

Mothers Milk Project

www.MothersMilkProject.org

**PLEASE DONATE
A SAMPLE OF YOUR BREAST MILK!**

We are collecting mothers milk within a 50-mile radius of the Indian Point Nuclear Power Plant in New York and Connecticut.

The milk will be analyzed confidentially for traces of radioactivity - strontium-90 - which is routinely released by Indian Point.

Strontium-90 causes birth defects, bone cancer and leukemia. Exposure increases risks for breast, lung and other soft tissue cancers.

Help us create a database of information.

The New York State Department of Health and Indian Point's owner stopped sampling cow's milk near Indian Point in 1991 - just as strontium-90 levels were increasing. They never sampled human breast milk.
